Education

Harvard University

Ph.D. in Business Economics, 2021 to 2027 (expected)

Visiting Student, Stanford Digital Economy Lab, 2026

M.A. in Business Economics, 2023

Massachusetts Institute of Technology

B.S. in Mathematics and in Economics, 2021

Fields

Labor Economics
Personnel Economics
Digital Economics and AI

Job Market Paper

Artificial Intelligence in the Firm: Bottlenecks in Software Production, *with James Stratton*

We study the impacts of AI coding assistants and agents on software engineering work, using a novel proprietary dataset from an engineering analytics platform, covering 300 million work events — including GitHub coding activity, Jira issues, and Google Calendar events — across 718 firms. We use a staggered difference-in-differences design, exploiting variation in firm-level adoption timing of AI coding assistants and agents. Both technologies lead to significant increases in coding productivity. However, productivity gains do not pass through to changes in software output or employment. For AI agents, this incomplete pass-through reflects a bottleneck from code review: review times increase, a larger share of code updates require revisions, and reviews involve more comments. In response, firms reallocate labor towards code review.

Papers in Progress

Task Assignment and Career Advancement, *with James Stratton*

Workers with the same job title often perform vastly different tasks — but how do differences in task assignment affect career advancement? We examine this question using data from an engineering analytics platform on tasks assigned to software engineers, merged with LinkedIn data on workers' career trajectories. Using an instrumental variables approach, we exploit quasi-random variation in task assignment arising from fluctuations in teams' task portfolios at the time workers join. Assignment to more complex tasks in the first quarter of employment significantly increases the likelihood of promotion within two years, consistent with greater opportunities for human capital accumulation and ability signaling. We explore the role of task assignment in gender disparities, documenting substantial gender differences in task assignment and persistent gender gaps in promotion.

AI as a Career Advisor, *with Katelyn Cranney and Leo Saenger*

We examine the role of AI in the job search process in partnership with CareerVillage, a nonprofit organization that provides AI-powered career guidance through its conversational tool, COACH. Traditional workforce development programs focus on preparing workers for specific occupations, such as IT or computer science. This approach is inherently prescriptive: the targeted occupations may not align with every worker's skills and preferences, and labor market conditions may evolve over time. We instead study whether AI can improve career decision-making by facilitating structured self-reflection, helping workers understand and articulate their skills and preferences, and evaluate tradeoffs across career options. We begin by using observational data to characterize how workers use COACH, finding that many conversations center on self-reflection. We are currently conducting a randomized controlled trial with unemployed job seekers to estimate the effects of AI-assisted self-reflection on career decision-making, employment outcomes, and longer-run job satisfaction.

The Labor Market Effects of AI: Current Evidence and Future Directions, *with Erik Brynjolfsson and Bharat Chandar*

How have generative AI technologies affected labor market outcomes? This question has attracted significant attention from economists and policymakers. We review and synthesize the emerging theoretical and empirical literature on the labor market impacts of generative AI. We organize the empirical evidence into three broad approaches: adoption-based studies comparing early and late adopters, exposure-based studies comparing occupations with differing levels of AI exposure, and survey-based evidence on workers' and firms' responses to AI. While exposure-based studies generally document declines in employment in AI-exposed occupations, the evidence from adoption-based studies and surveys is more mixed. We develop a framework for interpreting these findings by distinguishing between anticipation effects, automation effects, and the roles of partial and general equilibrium adjustments.

Policy Papers

Shaping the Future of Work: Generative AI, Inequality, and Opportunity, *The Social Finance Institute: Workforce and Economic Mobility Papers*, 17 December 2025

Employment & Service

MIT Corporation (Board of Trustees), *Trustee*	2021-26
Social Finance, *Research Fellow*	2025-26
Federal Reserve Bank of San Francisco, *Financial Supervision Intern*	2019

Fellowships & Awards
